Royal London Sustainable Diversified Trust **Climate metrics**

Following TCFD recommendations*

Portfolio data as of 31 December 2021

* TCFD Recommendations 2017

Royal London Sustainable Diversified Trust Content and context

This document compares the performance of the Royal London Sustainable Diversified Trust against its Index Benchmark, 30% UK FTSE All Share, 30% MSCI World, 40% iBoxx Non Sterling Gilts with portfolio data as of 31 December 2021 in four climate metrics. The climate data is the latest available at issuer-level sourced from both RLAM internal research and MSCI as of 1 March 2022. To allow for valuable comparison and appraisal alongside last year's figures, this report uses 2017 Taskforce for Climate-related Financial Disclosures (TCFD) recommendations and covers:

- Weighted Average Carbon Intensity (slides 2 and 3).
- Warming Potential (slides 4 and 5).
- Climate Value at Risk (slide 6)
- Green and Brown revenues exposure (slide 7).
- Data coverage for metrics (slide 8).
- Definitions of terms (slide 9).
- Methodologies used (slide 10).
- Disclaimers (slide 11).

Our disclosed metrics are subject to potential limitations due to the emerging nature of climate data applications and methodologies in finance. We endeavour to improve climate data in finance through our engagement with companies and data providers. We believe that technology innovations will make data more easily accessible and auditable in the future. We are also working with regulators, for example, as members of the Climate Financial Risk Forum (CFRF), to support disclosure standardisation. For more information on our Sustainable Fund range, including details of our Sustainable Fund themes, please see:

An investor's guide to sustainable investing.

Investment risk: The value of investments and any income from them may go down as well as up and is not guaranteed. Investors may not get back the amount invested.

Responsible Investment style risk: The Fund can only invest in holdings that demonstrate compliance with certain sustainable indicators or ESG characteristics. This reduces the number securities in which the Fund can invest and there may as a result be occasions where it forgoes more strongly performing investment opportunities, potentially underperforming non-sustainable funds.

Royal London Sustainable Diversified Trust Weighted Average Carbon Intensity

Weighted Average Carbon Intensity (WACI) measures a portfolio's exposure to carbon-intensive companies. All direct company emissions (Scope 1 & 2) are divided by companies' revenues, then multiplied based on their weighting within the portfolio to create a tCO₂e/\$m* revenue figure. In-line with updated TCFD recommendations, future reports shall include financed emissions.

		WACI**	
	2021	2020	YoY Change
Fund (tCO2e/\$m)	62.1	79.6	↓ 22%
Benchmark (tCO2e/\$m)	107.6	124.3	↓ 13%
Difference (%)	-42%	-36%	

The reduction in exposure to energy utility company SSE and a 32% overall decrease in exposure to the utilities sector are the primary reasons for the Fund's year-on-year decrease of WACI in 2021. This decrease is despite increased weightings in CSX and TSMC, which although being best-in-sector performers, still operate in carbon intensive industries (rail freight and semiconductors respectively).

* Metric tonnes of carbon dioxide equivalent emissions (as defined by the GHG Protocol). See slide 9 for further details.

** See slide 8 for data coverage figures.

Benchmark: 30% UK FTSE All Share, 30% MSCI World, 40% iBoxx Non Sterling Gilts.

For information purposes only. Sources: Portfolio data, RLAM as of 31 December 2021. Carbon intensity, RLAM and MSCI latest information available at issuer-level as of 1 March 2022. Certain information ©2022 MSCI ESG Research LLC. Reproduced by permission.

The Fund's WACI is 42% lower than that of its benchmark, and 22% lower than last year

Royal London Sustainable Diversified Trust Weighted Average Carbon Intensity – sector & top contributors

The table below shows the top 5 contributors to the portfolio WACI, and the sustainable theme they are linked to.

Top contributors to portfolio WACI	Sector	% of WACI contribution	% change from 2020	Sustainable theme*
SSE	Utilities	23.4%	-15%	Net benefit: energy transition
CSX	Industrials	6.7%	+55%	Net benefit: cleaner & safer transport
тѕмс	Technology	4.2%	+27%	Net benefit: digital world
Texas Instruments	Technology	3.9%	+44%	Net benefit: industry 4.0
Lonza Group	Health Care	3.8%	+41%	Net benefit: next generation medicine

The graph below shows the sector contribution to portfolio WACI.

* Please see An investor's guide to sustainable investing for more information on our Sustainable Fund themes.

Portfolio characteristics and holdings are subject to change without notice. This does not constitute an investment recommendation. For information purposes only. Sources: Portfolio data, RLAM as of 31 December 2021. Carbon intensity, RLAM and MSCI latest information available at issuer-level as of 1 March 2022. Certain information ©2022 MSCI ESG Research LLC. Reproduced by permission.

Utilities constitute over 49% of the Fund's total WACI, largely driven by SSE

Royal London Sustainable Diversified Trust Warming Potential

Warming Potential (WP) metrics aim to quantify the alignment of a company's activities against pathways commensurate with future temperature goals. WP incorporates a company's entire emissions (Scope 1, 2 & 3), as well as some of a company's reduction targets.

	Warming Potential			
	2021	2020	YoY Change	
Fund (%)	2.9	3.2	↓ 9%	
Benchmark (ºC)	3.3	3.5	↓ 6%	
Difference (%)	-12%	-9%		

The year-on-year decrease in WP is due to communications (42%), financials (10%), and consumer discretionary (7%) sectors' WP contribution reducing significantly. This also overrides a 36% increased contribution from the technology sector and specifically critical yet resource intensive semiconductor manufacturing, driven by TSMC and Texas Instruments.

Benchmark: 30% UK FTSE All Share, 30% MSCI World, 40% iBoxx Non Sterling Gilts.

For information purposes only. Sources: Portfolio data, RLAM as of 31 December 2021. Carbon intensity, RLAM and MSCI latest information available at issuer-level as of 1 March 2022. Certain information ©2022 MSCI ESG Research LLC. Reproduced by permission.

The Fund's WP is 12% lower than its benchmark, and 9% lower than last year

Royal London Sustainable Diversified Trust Warming Potential – sector & top contributors

The table below shows the top 5 contributors to the portfolio Warming Potential, and the sustainable theme they are linked to.

Top contributors to portfolio WP	Sector	% of WP contribution	% change from 2020	Sustainable theme*
Aptiv	Consumer Discretionary	2.7%	+23%	Net benefit: cleaner & safer transport
Rentokil Initial	Industrials	2.7%	+17%	Net benefit: hygiene & wellbeing
Texas Instruments	Technology	2.6%	+24%	Net benefit: industry 4.0
Amazon	Consumer Discretionary	2.2%	+83%	Net benefit: digital world
Thermo Fisher	Health Care	2.1%	+31%	Net benefit: next generation medicine

The Graph below shows the sector contribution to portfolio Warming Potential.

As climate data matures, new metrics are being developed and used as a form of undertaking scenario analysis. Implied Temperature Rise (ITR) is one such metric which enables us to determine the % of issuers that are 1.5°C aligned. Looking ahead, we will aim to include this metric in our 2022 fund reporting.

* Please see <u>An investor's guide to sustainable investing</u> for more information on our Sustainable Fund themes.

Portfolio characteristics and holdings are subject to change without notice. This does not constitute an investment recommendation. For information purposes only. Sources: Portfolio data, RLAM as of 31 December 2021. Carbon intensity, RLAM and MSCI latest information available at issuer-level as of 1 March 2022. Certain information ©2022 MSCI ESG Research LLC. Reproduced by permission.

The technology, health care and industrials sectors constitute over half the Fund's total WP

Royal London Sustainable Diversified Trust Climate change scenario stress-testing

Climate Value at Risk (C-VaR) aims to assess how climate change may reduce the investment return in portfolios over the next 15 years, in the absence of interventions, by evaluating two types of impact:

Transition impact: the low-carbon economy transition's risks and opportunities - through policy changes and technology opportunities.

Physical impact: the impact of extreme weather hazards – C-VaR provides insights into the potential stress on market valuation under different scenarios associated with global temperature trajectories.

A slow transition to low carbon (+3 °C scenario) exposes investments to irreversible climate physical risk. A swift transition to low carbon, such as scenarios reaching 2 °C and the quickest 1.5 °C has investments more exposed to transition risk.

		1.5 ⁰C			2ºC	
	2021	2020	YOY	2021	2020	YOY
Fund (equity portion, % market value at risk)	-3.1%	-3.9%	↓21%	-2.7%	-3.0%	↓ 10%
Benchmark (equity portion, % market value at risk)	-16.8%	-17.2%	↓ 2%	-13.0%	-11.8%	↑ 10%
Difference (%)	-82%	-77%		-79%	-75%	

The year on year reduction in C-VaR is due to the Fund reducing exposure to holdings in the utilities sector by 32%. Additionally, there has been a positive impact from holdings such as Schneider Electric in the industrials sector, which as an electrical power equipment producer is best placed to capitalise on the energy transition.

Benchmark: 30% UK FTSE All Share, 30% MSCI World, 40% iBoxx Non Sterling Gilts.

For information purposes only. Sources: Portfolio data, RLAM as of 31 December 2021. Carbon intensity, RLAM and MSCI latest information available at issuer-level as of 1 March 2022. Certain information ©2022 MSCI ESG Research LLC. Reproduced by permission.

The Fund's C-VaR below 1.5°C is 82% lower than its benchmark

Royal London Sustainable Diversified Trust Exposure to Green and Brown revenues

The exposure measures the percentage by value held in the portfolio with any revenue from an activity considered Green or Brown.

Green activities: renewable energy, energy efficiency, sustainable agriculture or water, green building and pollution prevention.

Brown activities: oil and gas (any part of the value-chain), coal mining and coal-based generation of electricity.

The Technology and Industrials sector account for nearly half (43%) of the Fund's total exposure to green revenues and have both increased weighting in 2021, resulting in the yearon-year increase. Conversely, the Fund's entire exposure to brown revenues comes from the utilities and industrials sectors, with SSE and CSX alone responsible for 78% of the Fund's brown revenues. We believe SSE is a leader in driving the transition to net zero and therefore, through its products and services, provides a net benefit to society. Similarly, CSX champions best practice in rail freight, maximising efficiency and benefit.

	Exposure to Green		Ex	posure Brown	e to	
	2021	2020	ΥΟΥ	2021	2020	ΥΟΥ
Fund (% value in portfolio)	33.1%	28.5%	↑ 16%	3.7%	27.2%	↓ 86%
Benchmark (% value in portfolio)	26.4%	11.9%	↑ 122%	10.7%	23.9%	↓ 55%
Difference (%)	+25%	+139%		-65%	+14%	

Benchmark: 30% UK FTSE All Share, 30% MSCI World, 40% iBoxx Non Sterling Gilts.

For information purposes only. Sources: Portfolio data, RLAM as of 31 December 2021. Carbon intensity, RLAM and MSCI latest information available at issuer-level as of 1 March 2022. Certain information ©2022 MSCI ESG Research LLC. Reproduced by permission.

The Fund has 25% more value in the portfolio exposed to green revenues than the benchmark and 65% less value exposed to brown revenues

Royal London Sustainable Diversified Trust **Data coverage for metrics**

Our data coverage is comprised of third-party data and in-house propriety RLAM research, allowing us to gain a better understanding, and give a clearer picture of the climate impact of this Fund.

Metric	Fund	(%)	Benchmark (%)		
	2021	2020	2021	2020	
WACI	97%	97%	92%	95%	
Warming Potential	86%	97%	81%	95%	
C-VaR	55%	59%	57%	58%	
Exposure to Green & Brown Revenues	N/A: See slide	e 10 for an expla	anation of metric	methodology	

Benchmark: 30% UK FTSE All Share, 30% MSCI World, 40% iBoxx Non Sterling Gilts.

For information purposes only. Sources: Portfolio data, RLAM as of 31 December 2021. Carbon intensity, RLAM and MSCI latest information available at issuer-level as of 1 March 2022. Certain information ©2022 MSCI ESG Research LLC. Reproduced by permission.

Royal London Sustainable Diversified Trust **Definitions of terms**

Term	Brief explanation of the term
tCO ₂ e Scope 1	All direct company greenhouse gas (GHG) emissions from owned or controlled sources. Other greenhouse gases, such as methane or nitrous oxide are converted to carbon dioxide hence reporting is under tCO ₂ e, where the 'e' stands for equivalent and t for metric tonnes. This follows the Greenhouse gases protocol, the most widely used accounting standard for emissions. FAQ.pdf (ghgprotocol.org)
tCO ₂ e Scope 2	Indirect company emissions from the generation of purchased electricity, steam, heating and cooling consumed by the reporting company. Other greenhouse gases, such as methane or nitrous oxide are converted to carbon dioxide hence reporting is under tCO ₂ e, where the 'e' stands for equivalent and t for metric tonnes. This follows the Greenhouse gases protocol, the most widely used accounting standard for emissions. <u>FAQ.pdf (ghgprotocol.org)</u>
tCO ₂ e Scope 3	Indirect company emissions that occur in a company's value chain both upstream (before their production) and downstream (after the sale of their products). Other greenhouse gases, such as methane or nitrous oxide are converted to carbon dioxide hence reporting is under tCO ₂ e, where the 'e' stands for equivalent and t for metric tonnes. This follows the Greenhouse gases protocol, the most widely used accounting standard for emissions. <u>FAQ.pdf (ghgprotocol.org)</u>
The Paris Agreement	The Paris Agreement is an international agreement that establishes a framework and commits all countries that ratify it to reduce their emissions so that that the global median warming remains well below 2 degrees Celsius. It also commits countries to work together to adapt to the impacts of climate change. The agreement was adopted in 2015 at the 21 st Conference of the Parties to the United Nations Framework Convention on Climate Change (UNFCCC), 189 nations have now ratified the Paris Agreement. <u>The Paris Agreement United Nations</u>
Task force on Climate-related Financial Disclosures	The Task force on Climate-related Financial Disclosures (TCFD) consists of 31 members from various organisations including banks, insurance companies, asset managers, large-non financial companies. In 2015 the G20 Finance Ministers and Central Bank Governors asked the Financial Stability Board to review climate risk. The FSB established the TCFD to develop recommendations for more effective climate-related disclosures that could promote more informed investment, credit, and insurance underwriting decisions, they published their recommendations in 2017. There are +2000 supporters of the TCFD across 78 geographies recommending disclosures on climate risk. <u>Task Force on Climate-Related Financial Disclosures (fsb-tcfd.org)</u>
Climate Financial Risk Forum	The Climate Financial Risk Forum is (CFRF) is an industry forum jointly convened by the Prudential Regulation Authority and Financial Conduct Authority to build capacity and share best practice in the financial sector on climate risk. It brings together senior representatives from across the financial sector, including banks, insurers, and asset managers. <u>Climate Financial Risk Forum Bank of England</u>

Royal London Sustainable Diversified Trust **Methodology notes**

Metric	Brief explanation of the metric
Weighted Average Carbon Intensity (WACI)	Portfolio's exposure to carbon-intensive companies, expressed in tCO ₂ e / \$M revenue. Scope 1 and Scope 2 GHG emissions are divided by companies revenues, then multiplied based on portfolio weights (the current value of the investment relative to the current portfolio value). This follows the recommended methodology by the Taskforce for climate-related Financial Disclosures. <u>E09 - Carbon footprinting - metrics.pdf (tcfdhub.org)</u> . The WACI is calculated as a weighted average sum of the holdings with carbon intensity coverage. For the portion of the fund where carbon data is not available, the holdings are removed and the remainder of the fund is re-weighted to 100%. The portion not covered by carbon intensity values are assumed to behave as the holdings with data available. The % of coverage by market value of the portfolio is based on all of the portfolio holdings including cash. Our equity data comes wholly from MSCI. For fixed income securities, RLAM has developed its own carbon intensity tool. The report uses RLAM data for the fixed income securities as a first port of call, supplementing with MSCI estimates where no reported or better estimate exists. RLAM's data for the emissions includes a combination of company disclosures through annual reporting, sustainability supplements and filings to the carbon disclosure project and primary research by our RI team. Where we lend to ring-fenced subsidiaries we have tried to source carbon data and revenues specific to those subsidiaries.
Warming Potential (WP)	Warming Potential metrics aim to quantify the alignment of a company's activities against pathways commensurate with future temperature goals. This metric incorporates current scope 1, 2 and 3 emission intensity and assumptions to estimate expected future emissions intensity for an entity. It also incorporates some of the companies' reduction targets and emissions it will contribute to avoid. The estimate is then translated into a projected increase in global average temperature above preindustrial levels. It is expressed in °C. The portfolio level warming potential is calculated as a weighted average sum of the holdings with warming potential coverage. For the portion of the fund where warming potential data is not available, the holdings are removed and the remainder of the fund is re-weighted to 100%. The % of coverage by market value of the portfolio is based on all of the portfolio holdings including cash. <u>73ccf115-0ed2-434b-553f-f10d0a1dfa1b (msci.com)</u>
Climate Value at Risk (C-VAR)	Climate Value-at-Risk (Climate VaR) model aims to provide an assessment on how climate change may affect the investment return in portfolios based on conditions associated with global temperature trajectories (e.g. 1.5, 2, 3C). By evaluating policy impact, technology opportunities and climate physical risk, under different scenarios associated with those temperature trajectories, the metric provides insights into the potential stress on market valuation, translating climate-related costs into possible valuation impacts. We selected two scenarios from the Asia-Pacific Integrated Assessment Computable General Equilibrium (AIM.CGE) model. This model is comprised by four integrated models: an economic model, a spatial model, an emissions constraints model and a climate model. The model is peer reviewed and its building blocks and key outputs are accessible through the International Panel of Climate Change database of climate models. This metric is only relevant for equities or the equity portion of a portfolio. At portfolio level it is calculated as a weighted average sum of the holdings with C-VaR coverage. For the portion of the fund where C-VaR data is not available, the holdings are removed and the remainder of the fund is re-weighted to 100%. The % of coverage by market value of the portfolio is based on all of the portfolio holdings including cash. <u>IAMC 1.5°C Scenario Explorer hosted by IIASA</u>
Exposure to Brown revenues	The percentage of instruments (by value) held in the portfolio through equity stake or bonds that have any exposure to revenues from oil and gas activity, coal mining and/or coal-based generation of electricity. This does not measure the total brown revenue derived from the portfolio just the count of issuers with any exposure to the activities defined above. As our trust on the revenue calculations increase we will re-evaluate this metric.
Exposure to Green revenues	The percentage of instruments (by value) held in the portfolio through equity stake or bonds that have any exposure to revenues from renewable energy, energy efficiency, green building, sustainable water and agriculture, and pollution prevention. This does not measure the total green revenue derived from the portfolio just the count of issuers with any exposure to green activities. As our trust on the revenue calculations increase we will re-evaluate this metric.

For further analysis on assumptions and limitations of the metrics we disclose please refer to Appendix III of our 2020 TCFD report.

Important Information

Although Royal London Asset Management Ltd's information providers, including without limitation, MSCI ESG Research LLC and its affiliates (the "ESG Parties"), obtain information (the "Information") from sources they consider reliable, none of the ESG Parties warrants or guarantees the originality, accuracy and/or completeness, of any data herein and expressly disclaim all express or implied warranties, including those of merchantability and fitness for a particular purpose.
