# The fund

## Fund performance objective and benchmark

The fund's investment objective is to achieve capital growth over the medium term (3-5 years), by investing at least 80% in the shares of UK medium-sized companies listed on the London Stock Exchange. The fund's performance target is to outperform, after the deduction of charges, the FTSE 250 ex-IT (investment trust) Total Return GBP Index (the "Index") over rolling 5-year periods. For further information on the fund's index, please refer to the Prospectus.

Benchmark: FTSE 250 ex-IT (investment trust) Total Return GBP Index

## Performance commentary

The fund returned -1.9% during the quarter, a disappointing outcome relative to its benchmark (FTSE 250 ex-IT index) return of 0.5%. The fund's underweight allocation to the energy sector, and overweight allocation to the telecoms sector, were both headwinds. Stock selection also contributed to the relative underperformance, however many of the individual holdings which underperformed have a shared characteristic, namely falling into the bucket of higher quality, higher growth businesses - which is very sensitive to movements in 10-year bond yields.

Hill & Smith was the top contributor during the period, following robust first half results. The business is benefitting from US corporates re-shoring their supply chains, investing into manufacturing capacity, and mostly significantly the various US government initiatives to boost infrastructure investment. These have bipartisan support – crucial given that they will run for a decade – and at a headline level introduce \$2 trillion in new federal spending over the next ten years. Hill & Smith's specific capabilities in galvanising, composites and engineered solutions across a range of infrastructure end markets are well placed to benefit from this sustained tailwind. Genuit, the provider of sustainable building materials, was another strong contributor. They bucked the trend of most peers operating in the UK building materials market, as a combination of price increases and significant operational efficiency improvements enabled them to announce solid interim results, and upgrade earnings guidance for the full year.

Detractors included online marketplace provider Auction Technology Group, specialist engineering group Oxford Instruments, and investment platform AJ Bell. None of these three reported significant results in the period and none saw material revisions to earnings estimates. However, all of them are typically categorized as "growth" stocks with higher expected long term earnings growth, higher than average margins and returns on capital, trading on higher than average earnings multiples – in a period where ten year yields increased in the UK and rose significantly in the US, growth stocks came under pressure and these were no exception.

## Fund activity

The fund initiated a new position in ITV, the vertically integrated TV producer, broadcaster and streamer, as well as IMI, the speciality engineering group. ITVX, ITV's new streaming platform, has been well received following an overhaul in user experience and an expansion in its content offering. Furthermore, the company's innovative Planet V platform, which allows agencies and advertisers to buy targeted video advertising, has been gaining traction. ITV also operates a successful studios business which has the potential to leverage the demand it has seen for content across third party platforms and geographies. The company has a solid balance sheet and is attractively valued for the growth on offer. The position was largely funded by the disposal of Dechra Pharmaceuticals, which is set to be delisted following the bid from Private Equity firm EQT

## Market review

Despite the flurry of first half corporate results, inflation data and interest rates remained at the forefront of investor mindsets during the third quarter. Data released in July showed that the rate of UK core inflation had slowed to 6.9%, meaningfully lower than most commentators had expected, and softening slightly further in August. As a result, Bank of England policy makers decided to hold base rates steady in September, ending their cycle of 14 sequential rate hikes. The US Federal Reserve also held rates steady in September. Indications are that policy makers will leave rates around current levels for longer than normal (rate cuts are not expected for some time), nevertheless it should not be overlooked that the current monetary policy tightening cycle - which has dominated financial markets for the last two years - is effectively over. Base rates have most likely peaked. This excites us, as in the fullness of time this should reduce pressure on equity market valuations, and should allow more focus on company specific fundamentals, as opposed to macroeconomic data being the primary determinant of returns.

UK equity markets initially rallied in July, with UK small and mid-cap indices leading the way following lower than expected inflation data and supported by a generally upbeat earnings season. However rising 10-year bond yields (as investors anticipated “higher for longer” base rates), and weak PMI and house price data (which raised concerns of a slowing domestic economy), resulted in equity market declines through August and September. The mid-cap FTSE 250 index significantly underperformed its large-cap FTSE 100 counterpart in this environment.

We are not normally avid followers of the minutiae in macroeconomic data, however a slew of revisions to UK GDP data in September did grab our attention. New ONS numbers suggested that the UK economy bounced back from the COVID pandemic significantly faster than initially estimated, with GDP now believed to have grown 1.8% between December 2019 and June 2023 – faster than France or Germany – compared to a previous estimate for a contraction. Figures for GDP growth in the first quarter of 2023 were also revised higher. While it is tempting to dismiss these revisions as another example of the issues with macro data, and why we avoid constructing the portfolio to fit any single macroeconomic outcome, there is an important narrative here. Specifically, that the UK economy has consistently been more resilient than expected through the sequential shocks of the pandemic, supply chain disruption and the cost of living crisis. In our view this speaks to the fact that corporate and consumer balance sheets were significantly repaired through Covid, resulting in less sensitivity to rising interest rates. It also suggests that the economy might be able to better withstand higher interest rates for some time without seeing a destructive economic contraction.

In positive news, the UK’s agreement to rejoin the EU’s Horizon science program in September is another sign of incrementally improving relationships with our largest trading partner. This follows the “Windsor Framework” in February and speaks to increased political stability, key to unlocking both foreign and domestic corporate investment into the economy.

## Outlook

There is considerable uncertainty about the outlook for the rest of 2023, with the risk that elevated interest rates could tip economies into a recession. However, corporate balance sheets remain very robust (meaning that the balance of power is in our hands as equity holders, rather than the debt holders), cost inflation is now receding (freight rates, raw materials and energy prices are materially lower than was the case a year ago) and much of the destocking and supply disruption following Covid appears to be moving into the rear-view mirror.

UK equity market valuations are currently at extreme levels. Indeed, the FTSE 250 is trading at the cheapest levels in 30 years relative to the FTSE 100 on a median 12-month forward dividend yield basis (Berenberg, September 2023). What has been interesting over the recent earnings season is how share prices have reacted to corporate newsflow. In several cases share prices have jumped significantly higher on in-line statements, suggesting investor sentiment has become overly negative. There is a reasonable argument to suggest that we are looking at a tempting combination of companies trading on trough valuations and trough earnings forecasts! It is of course difficult to predict the catalyst for improved UK stock market performance, but a normalisation in macroeconomic conditions and an end to UK equity outflows might just trigger it.

Our focus has always been on the long term and we continue to seek out companies with the valuable fundamental attributes that will allow them to ‘control the controllables’ in any economic environment. We continue to believe that it is these fundamental attributes that drive stock prices over the long term, and macroeconomic data or technical headwinds such as asset allocation flow can lead to short term mispricing. As such, we are excited by the opportunities currently on offer for UK investors.

# Risks and Warnings

## Investment Risk

The value of investments and any income from them may go down as well as up and is not guaranteed. Investors may not get back the amount invested.

## EPM Techniques

The Fund may engage in EPM techniques including holdings of derivative instruments. Whilst intended to reduce risk, the use of these instruments may expose the Fund to increased price volatility.

## Liquidity Risk

In difficult market conditions the value of certain fund investments may be difficult to value and harder to sell, or sell at a fair price, resulting in unpredictable falls in the value of your holding.

## Counterparty Risk

The insolvency of any institutions providing services such as safekeeping of assets or acting as counterparty to derivatives or other instruments, may expose the Fund to financial loss.
