Royal London Global High Yield Bond Fund

Quarterly Investment Report

30 June 2026

Quarterly Report

The fund as at 30 June 2026

The purpose of this report is to provide an update on the Royal London Global High Yield Bond Fund. The report has been produced by Royal London Asset Management. The report starts with a summary dashboard showing key information about the fund. A glossary is located at the end of the report covering the description of some of the more technical terms used within the report. All data is as at the report date unless otherwise stated.

The fund

Fund performance objective and benchmark

The investment objective of the Fund is to provide a combination of investment growth and income, the Fund will seek to achieve its objective on an active basis. The Fund seeks to achieve its investment objective by outperforming its benchmark, the ICE BoA BB-B Global Non-Financial High Yield Constrained Index (the "Benchmark") by 1% per annum over rolling three year periods. The Benchmark is being used by the Fund for performance comparison purposes only and the Fund does not intend to track it. For non-Base Currency Classes, the Benchmark shall be expressed in the relevant Class currency.

Performance commentary

High yield spreads were broadly rangebound in the second quarter, hovering around all-time tights. Despite this, we continue to see value in the asset class and the performance of the fund and market in the second quarter highlights this.

The carry in the asset class is now the central theme for returns, where investors are now compensated for any spread widening – but it is hard to see where this widening might come from as the high yield market continues to ignore any geopolitical volatility.

Events in the Middle East once again dominated headlines, with the evolution of the conflict between Iran and the US and Israel leading to heightened volatility in oil prices dictating the movement in government bond yields. There was a clear correlation in the period between the rise in oil prices and resulting adjustment in the expectation in the direction of future interest rate decisions.

Oil prices hit their peak in early April, sitting well above \$100 per barrel, with volatility continuing through the period where we only began to see this fall in June around headlines of a resolution to the conflict and the Strait of Hormuz re-opening allowing the safe passage of oil tankers through the region. Government bond yields hit quarter-highs in mid-May and then fell into quarter-end.

Over the three months to the end of June, global high yield markets recovered strongly from the volatility seen earlier in the year, with returns supported by an improvement in geopolitical sentiment, resilient macroeconomic data and continued confidence in corporate fundamentals. April marked the turning point for risk assets.

Although there was no firm resolution to the conflict in the Middle East, the ceasefire helped investors assume that the Strait of Hormuz would reopen sooner rather than later and that the broader impact on the global economy would be contained. This improvement in sentiment, combined with stronger macro data, drove a tightening in high yield spreads. Government bond yields moved higher, but the strength of spread tightening more than offset this, allowing the market to produce a positive returns in the first month of the quarter.

The rally broadened in May, with global high yield markets ending the month strongly as investors increasingly expected the war in the Middle East to end. Spreads tightened further. Performance was broadly positive across the market, with the exception of consumer goods, and the rally became more pronounced in the second half of the month.

Performance and activity

Performance commentary (continued)

European assets outperformed other regions on a relative basis, having been among the areas most affected by the earlier outbreak of the conflict, while BB and single B rated assets both delivered positive returns, with single B assets slightly ahead on a relative basis, which was reflected in the fund's outperformance with our overweight position versus the benchmark.

In June, markets remained resilient despite a more challenging rates backdrop, as government bond yields rose. High yield spreads still tightened further, ending the quarter at 238bps, helping the asset class deliver a strong quarterly return. This meant that, over the full three-month period, the market benefited from a consistent compression in credit spreads, even as government bond yields moved higher.

By rating, the fund's single B bonds outperformed the benchmark, with our overweighting to single B names the main driver of relative performance. Regionally, European high yield names recovered from a tough first quarter, which was beneficial for the fund. Our UK holdings were also a strong contributor to relative performance.

Our capital goods bonds delivered strong absolute and relative performance with our leisure bonds also contributing to the outperformance.

Fund activity

The stability in yield and duration over the quarter, alongside positive returns, highlighted the role that spread tightening and income continued to play in supporting the asset class – allowing us to feel confident in the fund's positioning going forward. Over the quarter there was a slight increase in building single B assets.

Primary market activity also provided an important signal of improving risk appetite. April saw the strongest monthly issuance since September 2025, with \$38.5bn issued in the US high yield market and \$57.4bn issued across global high yield. Activity moderated in May, with US high yield issuance falling by around \$12bn to \$26.6bn, while global issuance was only slightly lower at \$56bn. New supply remained skewed towards higher-quality BB issuers, with proceeds primarily used for refinancing rather than new debt. Overall, the period was characterised by a steady rebuilding of investor confidence.

Regionally, the fund increased exposure to UK bonds, while decreasing our US and Europe exposure. Included in this was taking part in a new issue from North Sea exploration firm EnQuest, offered at an attractive yield, as well as a new short-dated issue from Borr Drilling.

While potentially strained values in the AI sector were causing negative sentiment in investment grade bond and equity markets, the US tech sector makes up a small part of the high yield market. Despite this, contagion risk continues to exist. As such, names further down the capital stack came under pressure but this began to reverse on the outbreak of the US-Iran conflict with BB assets underperforming single B assets due to their longer duration.

Market commentary

Market overview

Headlines and markets were dominated by the US and Iran during the past quarter. The disruption to oil supply via the Strait of Hormuz pushed oil prices to levels last seen following the Russian invasion of Ukraine in 2022. Although a ceasefire was announced towards the end of the period, causing prices to ease, these remain above pre-crisis levels.

From a macroeconomic perspective, growth forecasts remain subdued, and inflation remains above central bank target levels. The major change over the quarter was central bank rate expectations. At the start of the period, markets were pricing in multiple hikes in the US, euro zone and UK, but these expectations were tempered as the period progressed – with the changing outlook the key driver of markets over the quarter.

In the wake of the conflict in the Middle East, business surveys pointed to slower growth in Q2. The UK and euro area composite PMI business survey data indicated a modest contraction in private sector output. The US composite PMI held up better, above 50 and rising over most of Q2. Manufacturing was supported by firms bringing forward activity ahead of expected price rises and potential shortages. However, as tensions in the Middle East calmed and the oil price fell, the June survey data pointed to some unwind of that support.

Higher oil and gas prices pushed up headline inflation across most economies, primarily via fuel and energy-related components. Business surveys also pointed to a squeeze on input costs and a deterioration in delivery times, reflecting supply chain disruptions. By June, however, there were signs of easing supply chain disruptions following increased shipping flows through the Strait of Hormuz.

Government bond markets remained volatile during the second quarter as markets balanced persistent inflation pressures, shifting central bank expectations and ongoing geopolitical uncertainty. However, markets moved away from the sharp repricing seen in the first quarter, with some support returning to duration by quarter end as energy prices retreated, and fears of a prolonged supply shock eased. Yield movements were driven less by expectations of imminent rate cuts and more by concerns that policy rates may need to remain higher for longer. Short-dated bonds experienced the largest swings as markets reassessed monetary policy paths, while longer-dated yields reflected uncertainty around inflation, growth and fiscal borrowing requirements, particularly, in the UK, in view of the potential change of UK prime minister and policy changes that this might also bring.

In the UK, 10-year gilt yields rose above 5% during May before retracing some of those gains, ending June at 4.76%. US Treasury yields also moved higher over the quarter, with the 10-year

treasury yield ending June at 4.44%. Across Europe, government bond markets experienced similar volatility as markets adjusted expectations for the pace of future policy easing. The German 10-year bund yield was 2.87% at the end of the second quarter, down from 2.98% three months prior.

In the high yield market, the ICE BofAML (BB-B) Global Non-Financial High Yield Index (sterling hedged) benchmark returned 2.96% in the second quarter with spreads ending the three-month period at 238bps, tightening from 297bps, at the start of the quarter. At the end of the period, the index's yield-to-worst stood at 6.26% down from 6.75% three months earlier. In the broader-based high yield index, which includes CCC rated bonds, yield-to-worst fell to 6.78% from 7.42%.

Economic overview

The US Federal Reserve kept rates on hold in both April and June. The June participant projections, however, showed nine out of 18 participants pencilling in a 2026 rate hike alongside upward revisions to the median inflation forecast, although the projections would not have fully reflected the fall in the oil price seen later in the quarter. Kevin Warsh replaced Jerome Powell as chairman of the US Federal Reserve and in June held his first press conference. He avoided giving guidance on the path for interest rates but struck a more hawkish tone than many anticipated.

US tariff refunds under the IEEPA framework began, but the US announced a new 10-12.5% tariff on a large number of trading partners relating to forced labour in supply chains. US Q1 GDP (released in Q2) grew a respectable 2.1% quarter-on-quarter annualised, after 0.5 % in Q4 (which was affected by the government shutdown). Business surveys continued to signal solid growth in Q2.

The European Central Bank (ECB) raised rates by 25bps in June as the inflation impact of higher energy prices showed signs of broadening. Euro area GDP fell 0.2% quarter-on-quarter in Q1, although the fall was exaggerated by GDP volatility in Ireland.

Labour market trends have diverged somewhat. In the US, employment growth saw signs of increased momentum after a year of subdued employment growth. The euro area unemployment rate remained near historically low levels. However, the UK labour market remained soft. The number of payrolled employees fell on average over April and May, though the unemployment rate was relatively stable. Vacancies have fallen and the PMI employment indicator remained weak compared to other countries.

Headline inflation jumped in most economies, reflecting higher energy costs. In the US, CPI inflation jumped up from 2.4% year-on-year in February to 4.2% year-on-year by May. UK

Market commentary

inflation has been bumpy over the quarter but is widely expected to rise after household energy bills reflect higher wholesale prices in July (when the Ofgem price cap updates). In the euro area, higher energy prices pushed inflation from near the 2% target to 3.2% by May.

Outlook

High yield fundamentals are well supported and that has resulted in a very moderate default climate up to now. Current US high yield default rates are very low, as are global high yield defaults.

And these technical factors should help keep high yield spreads relatively tight, while investor focus remains on the attractive level of all-in yields. Spreads are likely to remain rangebound, with few obvious catalysts for meaningful widening, particularly as markets continue to absorb geopolitical tensions in the Middle East.

The anticipated uncertainty around the appointment of a new US Federal Reserve Chair proved less disruptive than expected. Kevin Warsh's more reassuring tone, including an emphasis on maintaining the Fed's independence, helped to calm market concerns.

While global geopolitical and macroeconomic uncertainties are affecting global government bond markets in different ways, and despite where credit markets have reached in spreads, we believe that global high yield markets still offer attractive sources of value for those prepared to look carefully.

Royal London Asset Management's High Yield strategy remains anchored in a long-term, repeatable investment processes that combines top-down credit cycle assessment with bottom-up fundamental research. We continue to focus on quantifiable credit risks, disciplined stock selection and portfolio construction, seeking to identify attractive opportunities while avoiding business models or structures where the risk is difficult to forecast. This approach is designed to support consistent income generation, reduce default risk and provide resilience across different market environments.

Risks and Warnings

Investment risk

The value of investments and any income from them may go down as well as up and is not guaranteed. Investors may not get back the amount invested.

Credit risk

Should the issuer of a fixed income security become unable to make income or capital payments, or their rating is downgraded, the value of that investment will fall. Fixed income securities that have a lower credit rating can pay a higher level of income and have an increased risk of default.

EPM techniques risk

The Fund may engage in EPM techniques including holdings of derivative instruments. Whilst intended to reduce risk, the use of these instruments may expose the Fund to increased price volatility.

Exchange rate risk

Investing in assets denominated in a currency other than the base currency of the Fund means the value of the investment can be affected by changes in exchange rates.

Interest rate risk

Fixed interest securities are particularly affected by trends in interest rates and inflation. If interest rates go up, the value of capital may fall, and vice versa. Inflation will also decrease the real value of capital.

Liquidity risk

In difficult market conditions the value of certain fund investments may be difficult to value and harder to sell, or sell at a fair price, resulting in unpredictable falls in the value of your holding.

Emerging markets risk

Investing in Emerging Markets may provide the potential for greater rewards but carries greater risk due to the possibility of high volatility, low liquidity, currency fluctuations, the adverse effect of social, political and economic instability, weak supervisory structures and accounting standards.

Counterparty risk

The insolvency of any institutions providing services such as safekeeping of assets or acting as counterparty to derivatives or other instruments, may expose the Fund to financial loss.

Responsible investment risk

The Fund can only invest in holdings that demonstrate compliance with certain sustainable indicators or ESG characteristics. This reduces the number securities in which the Fund can invest and there may as a result be occasions where it forgoes more strongly performing investment opportunities, potentially underperforming non-sustainable funds.

Sub-investment grade investment risk

Lower rated investment grade securities may have large uncertainties or major risk exposures to adverse conditions. The market value of securities in lower rated investment grade categories is more volatile than that of higher quality securities, and the markets in which these securities are traded are less liquid than those in which higher rated securities are traded.

Derivative risk

Derivatives are highly sensitive to changes in the value of the underlying asset which can increase both Fund losses and gains. The impact to the Fund can be greater where they are used in an extensive or complex manner, where the Fund could lose significantly more than the amount invested in derivatives.

Glossary

Asset allocation

Breakdown of the assets by asset classes. Based on RLAM asset classification scheme.

Bonds

Securities that represent an obligation to repay a debt, with interest. Investment grade bonds are high quality bonds that are viewed as being highly likely to make all scheduled payments of interest and principal. Low quality bonds carry higher risk but also typically pay higher rates of interest. Corporate bonds are those issued by companies to raise finance.

Credit ratings

Credit ratings are based on RLAM composite ratings which uses a hierarchy of S&P, Moody's and then the Fitch rating.

Currency hedged share classes

Currency Hedged Share Classes aim to provide investors with a return highly correlated to the return of the base currency share class by minimising the impact of exchange rate fluctuations between the base currency of the Fund and the investor's chosen currency. Derivatives are typically used to hedge the relevant share classes.

Derivatives

A financial instrument whose price is dependent upon or derived from one or more underlying asset.

Duration

Measure of sensitivity of a Fixed Income instrument to changes in interest rates, indicating the potential impact of interest rate fluctuations on the value of the investment.

Efficient Portfolio Management (EPM) techniques

The Fund may engage in EPM techniques including holdings of derivative instruments. The use of these instruments may expose the Fund to volatile investment returns and increase the volatility of the net asset value of the Fund. EPM techniques may involve the Fund entering into transactions with counterparties where there may be a risk of counterparty default. The Fund's ability to use EPM strategies may be limited by market conditions, regulatory limits and tax considerations.

Fund analytics

All figures exclude cash. Credit bonds include non-sterling bonds and CDs where held within the fund or benchmark.

This is applicable to the following sections: fund Asset Allocation, Duration, Yield curve, Sector breakdown, Financial holdings, Credit ratings.

Maturity Profile

Maturity classifications reflect issue maturity date, not market interpretation of redemptions

Performance

Both the Fund and Index performance are based on close of business prices.

Pricing

The Fund's price may swing to bid or offer to protect existing investors from the costs associated with buying or selling the fund's underlying assets when other investors are entering or leaving the fund. Performance is based on this pricing.

Redemption yield

The weighted average rate of discount at which the future obligations of interest and capital payments of each of the fund's holdings excluding cash, in each case calculated to the point in time at which each is expected to redeem, equates to its current price, gross of relevant fund management costs and gross of tax. For funds that are sold in various hedged currency share classes, yield is adjusted to reflect the impact of FX hedging and excludes the impact of cash.

Top 10 holdings

Top 10 assets held by market value, excluding derivatives and cash.
