Royal London Short-Term Money Market Fund

Quarterly Investment Report

30 September 2026

Quarterly Report

The fund as at 30 September 2026

The purpose of this report is to provide an update on the Royal London Short-Term Money Market Fund. The report has been produced by Royal London Asset Management. The report starts with a summary dashboard showing key information about the fund. A glossary is located at the end of the report covering the description of some of the more technical terms used within the report. All data is as at the report date unless otherwise stated.

The fund

Fund performance objective and benchmark

The Fund aims to preserve capital and generate income, over rolling 12-month periods, before the deduction of fees. A performance comparator for the Fund is the Bank of England Sterling Overnight Interbank Average ("SONIA"). SONIA is the average overnight interest rate UK banks pay for unsecured transactions in sterling that is a widely recognised approach to benchmarking short-term money market and fixed income funds and therefore is considered an appropriate performance comparator. Another performance comparator for the Fund is the IA Short Term Money Market sector (the "IA Sector").

Duration profile

Performance commentary

The underlying trend of note during the quarter was longer money market rates rising to reflect increased concerns over second round inflation effects and stronger growth translating into a number of Bank of England rate increases over the next 12 months. This effect was particularly visible in September.

Performance was ahead of the SONIA benchmark over the quarter. Our money market exposure was the main driver of returns, reflecting that this makes up the bulk of the fund's assets. Rising money market rates are a headwind for any liquidity or fixed income fund that has duration exposure. We had increased the fund's weighted average life (WAL) in the earlier part of the second quarter, before allowing this to drift lower through most of the summer. As a result, although the impact of rising rates on our longer money market holdings was negative, this impact was mitigated. In addition, a modest proportion of our money market exposure was in floating rate CDs, which also did relatively well.

Our diversified approach also helped. A material part of the fund's assets are short-term in nature, notably overnight deposits and repo, and this allowed us to reset at higher yields through the period, adding to returns, with the small exposure to covered bonds also helpful given that these assets are floating rate and pay a healthy premium over SONIA.

Performance and activity

Fund activity

Markets have moved to price in significant rate rises more than once this year. On each occasion, we felt that market reaction to short-term economic data was overshooting where the Bank of England will end up. Our investment approach is predicated on looking at value versus our models, rather than betting on macro outcomes, but we do see greater opportunity to add longer yields when markets overshoot.

In practice, this means that rather than a wholesale move into long-dated paper, we will look to pick up paper from names that score highly on our credit quality and ESG scores, and look attractive on our valuation models. This was most noticeable in September when rates had jumped materially, when we added six-month CDs from Lloyds Bank and Rabobank, as well as one-year paper from Canadian Imperial Bank of Commerce and NatWest, the latter already pricing in almost four increases in Bank of England rate and hence offering a very attractive yield.

Looking beyond CDs, we continue to add UK treasury bills as part of a diversified portfolio. These are attractive given the lack of credit risk, with activity in the quarter focused at short-dated maturities where we still earned a material premium to SONIA. We also looked for opportunities to add to short-dated covered bonds in the secondary market – typically with less than a year to maturity, as the floating rate nature of these helps manage overall interest rate risk, adding Santander UK and Toronto Dominion six-month covereds over the period.

Market commentary

Market overview

Global economic activity remained resilient over the quarter despite a more challenging backdrop of higher energy prices, rising government bond yields and renewed monetary policy tightening. US growth continued to be supported by robust household spending and a relatively firm labour market. The euro area also performed more strongly than expected, with second-quarter GDP recording its fastest quarterly expansion in four years, supported by consumption, exports and manufacturing activity.

Fixed income markets weakened over the period as persistent inflationary concerns and elevated energy prices prompted investors to reassess the path of monetary policy. The Federal Reserve, European Central Bank and Bank of Japan all raised interest rates during the quarter, while expectations increased that the Bank of England would also tighten policy. Government bond yields rose sharply, particularly at shorter maturities, as markets priced a higher path for policy rates, while longer-dated bonds weakened on fiscal concerns and rising issuance.

During the quarter, Andy Burnham became UK Prime Minister. The government reaffirmed commitment to the fiscal rules which, alongside higher inflation and higher bond yields weighing on the fiscal headroom, leaves little room for manoeuvre in the October budget. Towards the end of the quarter, Burnham proposed changes to the pension triple lock to help fund new social care policy and indicated a willingness to reassess the UK's relationship with Europe. However, the proposals were light on details and not expected to take effect until after the next election, likely from 2030.

In the UK, the government's Debt Management Office sold £4.25 billion of July 2036 gilts at an average yield of 5.383% at the end of September, the highest 10-year borrowing cost since 1999. Demand for higher yields reflected ongoing inflation concerns and expectations of increased fiscal spending ahead of the forthcoming Autumn Budget. Monetary policy expectations also shifted over the quarter and markets started pricing in a 25bps rate hike in November, with roughly four increases priced in by the middle of next year.

UK 10-year gilt yields ended September at 5.43% compared to 4.76% at the end of June. US treasury yields also moved higher over the quarter, with the 10-year treasury yield ending September at 5.28%, having closed at 4.44% at the end of June. Across Europe, government bond yields similarly pushed upwards. The German 10-year bund was 3.55% at the end of September, up from 2.87% three months prior.

While government bond volatility has been a notable feature of 2026, the stability of UK interest rates means that SONIA, the Sterling Overnight Index Average, has been virtually unchanged. This continued through the third quarter, with this unchanged at 3.73%. Further along the money market curve, changing market expectations about future Bank of England policy have seen sharp movements. During the quarter, the market moved to price in significant rate hikes over the following 12 months, with two-year gilt yields, often seen as a proxy for market expectations of BoE rates, moving significantly higher, from 4.18% to 4.75%.

Outlook

The global impact of the conflict in the Middle East is not yet fully visible. Since its commencement in February, we have seen hopes of ceasefire or more permanent resolution increase and fall on a number of occasions. Oil supplies have been disrupted and are likely to remain so for some time, even if somewhat mitigated by the reopening of the East-West Saudi pipeline towards the end of the quarter. As stated previously, this has a simple and predictable first round impact on inflation, with price rises feeding through into elevated headline inflation this year and expected to then fall back in 2027 due to the base effects of year-on-year comparisons. The short and medium-term impact on growth is harder to predict, but historically, sudden sharp increases in energy prices have had a negative impact on global growth.

With inflation higher on a technical basis, and second-round effects also likely to push inflation higher as workers look for higher wages to offset higher cost of living, it would have been easy for central banks to start increasing interest rates in the spring or summer. Concerns over the impact on growth have undoubtedly slowed down those increases, but with economic growth proving resilient, we have now seen the Fed and ECB increase rates, with a November increase from the Bank of England fully priced into markets.

For the BoE, we believe that the pressure to increase rates will see an increase shortly. However, we note that markets are not just pricing in a November hike, but three subsequent increases, taking rates 100bps higher by summer 2027 and then remaining flat for some time. That pattern of monetary policy changes feels unlikely in our view, given that it assumes inflation increases and then remains high for some time, and that the impact of fuel price increases will be negligible on consumption and therefore overall growth. We also have the first budget of the new Prime Minister in Autumn, which will also undoubtedly impact BoE thinking and market pricing.

While we target an attractive yield in the portfolios, we are mindful of liquidity and security as well, therefore preferring to look for value on a case-by-case basis using our models, rather than implementing large-scale macro or interest rate calls. We continue to believe that the overall yields in our liquidity and short-term fixed income funds remain attractive for investors.

Risks and Warnings

Investment risk

The value of investments and any income from them may go down as well as up and is not guaranteed. Investors may not get back the amount invested.

Credit risk

Should the issuer of a fixed income security become unable to make income or capital payments, or their rating is downgraded, the value of that investment will fall. Fixed income securities that have a lower credit rating can pay a higher level of income and have an increased risk of default.

EPM techniques risk

The Fund may engage in EPM techniques including holdings of derivative instruments. Whilst intended to reduce risk, the use of these instruments may expose the Fund to increased price volatility.

Interest rate risk

Fixed interest securities are particularly affected by trends in interest rates and inflation. If interest rates go up, the value of capital may fall, and vice versa. Inflation will also decrease the real value of capital.

Counterparty risk

The insolvency of any institutions providing services such as safekeeping of assets or acting as counterparty to derivatives or other instruments, may expose the Fund to financial loss.

Inflation risk

Where the income yield is lower than the rate of inflation, the real value of your investment will reduce over time.

Money market fund risks

A Money Market Fund is not a guaranteed investment, and is different from an investment in deposits. The principal invested in the Fund is capable of fluctuation and the risk of loss of the principal is to be borne by the investor. The Fund does not rely on external support for guaranteeing the liquidity of the Fund or stabilising the NAV per share.

Glossary

Asset allocation

Breakdown of the assets by asset classes. Based on RLAM asset classification scheme.

Money market instruments

Investments that pay interest, have a short duration and are designed to maintain a stable value.

Number of issuers

Number of unique issuers of all assets held by the Fund, excluding cash, currency and derivatives.

Performance

The Fund price is taken at mid-day using swing prices where applicable, while the index performance is priced at close of business. Significant intra-day market movements at the start or end of the day may therefore distort comparisons.

Pricing

The Fund's price may swing to bid or offer to protect existing investors from the costs associated with buying or selling the fund's underlying assets when other investors are entering or leaving the fund. Performance is based on this pricing.

Ratings

Credit-rating agencies rate bonds based on the likelihood of them defaulting and being unable to repay their debt.

Redemption yield

The weighted average rate of discount at which the future obligations of interest and capital payments of each of the fund's holdings equates to its current price, gross of relevant fund management costs and gross of tax.

Reverse repurchase agreements

Agreeing to sell a purchased security at a specified later date.

Rolling 12 month period

A rolling 12 month period is any period of twelve months, no matter which day you start on.

Weighted average maturity

The average length of time to maturity of all underlying securities in the fund weighted to reflect the relative holdings in each instrument, assuming that the maturity of a floating rate instrument is the time remaining until the next interest rate reset to the money market rate, rather than the time remaining before the principal value of the security must be repaid.
