The fund

Fund performance objective and benchmark

The Fund's investment objective is to achieve a combination of capital growth and income over rolling 5-year periods while seeking to target volatility of 4-8% per annum, by employing diversified multi-asset strategies. There is no guarantee that volatility in this range will be achieved and it has been chosen as it represents a level of risk which is appropriate for the Fund. Volatility is a statistical measure of the Fund's possible range of outcomes. For the Fund, volatility will be calculated as the annualised standard deviation of daily Fund prices over rolling 12-month periods. The Fund is actively managed, meaning that the manager will use their expertise to select investments to meet the objective. For performance comparison purposes, the average return of the Morningstar GBP Allocation 20-40% Equity category may be used. The Morningstar GBP Allocation 20-40% Equity category is a peer group of funds that each invest in a range of asset types including equities, bonds, property, commodities, cash and liquid alternatives, which broadly aligns to the Fund's own investment policy. For funds in this category, equity or equity equivalent risk will usually be between 20% and 40% in the normal running of the fund. Management of the Fund is not restricted by the use of the category as a comparator benchmark.

Performance commentary

Equities

Global equities were broadly unchanged over the quarter, masking considerable month-to-month volatility. Markets stalled in July as escalating tensions in the Middle East offset a strong US corporate earnings season, before rebounding in August as resilient economic data and earnings supported investor sentiment. Equities edged slightly lower again in September as renewed geopolitical concerns and rising bond yields outweighed the continued earnings tailwind.

Portfolio positioning was adjusted dynamically throughout the quarter. Global equity exposure was reduced in July as geopolitical risks escalated and parts of the market linked to artificial intelligence came under pressure. Equity exposure was subsequently increased as investor sentiment became overly depressed, which added value as markets rebounded in August. The portfolio then maintained a positive tactical position in equities through September.

Bonds

Government bonds had a difficult quarter, with yields rising across the major developed markets. Both UK and US 10-year government bond yields rose to their highest levels since 2007. Higher energy prices were an important driver, while resilient economic data and a more hawkish tone from central banks added further upward pressure. Long-dated yields reached multi-year highs in several markets during August, before the Federal Reserve, European Central Bank and Bank of Japan all raised interest rates in September. The fund maintained a negative tactical view on government bonds, which added value throughout the quarter.

The fund continues to remain neutral on global high yield having reduced exposure when the Iran War started in February of this year. While risky assets have rallied sharply over recent months, fixed income markets remain volatile, and credit spreads remain near historically tight levels.

Commodities

Commodity prices jumped sharply in Q3. While oil prices were a key contributor, rising over 20% on supply concerns, agriculture and metals also rose on a combination of global demand resilience and renewed inflation concerns. The funds' strategic preference for commodities combined with a positive tactical view proved beneficial for returns.

Performance and activity

Performance commentary (continued)

Equity regions

Regional leadership shifted in Q3, with emerging markets (EM) notably underperforming in July as Korean shares suffered their worst month since the Global Financial Crisis (GFC) before reversing strongly over the rest of the period. Similarly, Japanese equities were initially hindered by foreign exchange (FX) interventions mid-quarter but bounced back as the yen resumed weakening. The funds' tactical preference for Japanese equities detracted during July's artificial intelligence-led sell-off.

Equity sectors

The technology and energy sectors were favoured in Q3 over areas such as communications and the consumer discretionary sector. While semiconductor stocks struggled to sustain their earlier momentum in Q3 amid concerns around valuations and the pace of future earnings growth, the overall US technology sector did relatively well over the period. The energy sector posted strong performance over the quarter as oil prices remained elevated due to the ongoing war in the Middle East. As a result, sector positioning contributed positively to fund performance.

Fund activity

MAST aims to capture upside in positive market trends, while limiting downside during periods of market turbulence through diversification, active positioning, and volatility management.

The core equity exposure within the fund was managed dynamically during the quarter. The fund entered the period with a 29% allocation, which was reduced to 28.5% at the end of July, reflecting a rise of volatility and increased uncertainty in the Middle East. As market volatility then declined during August, equity exposure was returned to its 30% core level in the middle of the month and remained there through to the end of the period.

We continue to remain vigilant, in these volatile market conditions, with the ability to react accordingly. We continue to monitor the situation daily – this helps us manage volatility, and the potential for loss.

Market commentary

Market Review

Global economic activity remained resilient over the quarter despite a more challenging backdrop of higher energy prices, rising government bond yields and renewed monetary policy tightening. US growth continued to be supported by robust household spending and a relatively firm labour market. The euro area also performed more strongly than expected, with second-quarter GDP recording its fastest quarterly expansion in four years, supported by consumption, exports and manufacturing activity.

Global equity markets remained comparatively resilient, supported by strong corporate earnings and continued confidence in the AI-related investment cycle. In the US, second-quarter earnings growth was broad-based, extending beyond the largest technology companies to include energy, financials and industrials. Continued investment in data centres, semiconductors, power generation and supporting infrastructure also reinforced expectations that the benefits of AI-related capital expenditure could spread across a wider range of sectors. European equities also held up well despite higher interest rates and political uncertainty, particularly in France, although elevated valuations and the prospect of further monetary tightening restricting the scope for a broader uplift in valuations.

Fixed income markets weakened over the period as persistent inflationary concerns and elevated energy prices prompted investors to reassess the path of monetary policy. The Federal Reserve, European Central Bank and Bank of Japan all raised interest rates during the quarter, while expectations increased that the Bank of England would also tighten policy. Government bond yields rose sharply, particularly at shorter maturities, as markets priced a higher path for policy rates, while longer-dated bonds weakened on fiscal concerns and rising issuance.

Commodity prices rose sharply on the quarter and resumed their firm leadership as the top performing asset class year-to-date. Oil prices rose sharply in July and remained high given the ongoing geopolitical risks. Gold was a standout performer in August as central-bank buying and diversification away from the US dollar returned.

Outlook

At the time of writing, the Investment Clock is in Stagflation, which is holding us back from what would otherwise be a more positive position on stocks given strong trends in corporate earnings. We see little risk of recession in the near term. In fact, rising business confidence raises the potential of a move back towards Overheat – a period characterised by strong commodity prices, rising bond yields, analyst earnings upgrades and central bank rate hikes.

A prolonged series of interest rate increases could tip the world economy into recession and deflate heady stock market valuations, but in our view, the monetary tightening to date is not sufficient to pose such a threat.

In the meantime, we are strategically tilted away from US equities on valuation grounds towards the better-value UK market. Tactically, we are positive on stocks, especially in the technology sector and in regions like the US, Japan and selected emerging markets which benefit most from the AI boom. Current events don't only recall the 1990s, though. Geopolitical upheavals reminiscent of the 1970s mean we also favour exposure to commodities, including gold.

Risks and Warnings

Investment risk

The value of investments and any income from them may go down as well as up and is not guaranteed. Investors may not get back the amount invested.

Credit risk

Should the issuer of a fixed income security become unable to make income or capital payments, or their rating is downgraded, the value of that investment will fall. Fixed income securities that have a lower credit rating can pay a higher level of income and have an increased risk of default.

Derivative risk

This fund may undertake transactions in derivatives and forward transactions (both on exchange and over the counter (OTC)). These may include interest rate swaps and interest rate futures for the purposes of meeting the investment objective, protecting the risk to capital, duration and credit management, as well as for hedging. While the discerning use of derivatives can be beneficial, derivatives also involve specific risks. These risks relate specifically to market risk, management risk, credit risk, liquidity risk, the risk of mispricing or improper valuation of derivatives and the risk that derivatives may not correlate perfectly with underlying assets, interest rates and indices. The use of derivative instruments may from time to time alter the economic exposure of the fund causing it to deviate significantly from the performance of the market as a whole. The use of these derivatives will be within the parameters allowed for linked funds by the Financial Conduct Authority and Prudential Regulation Authority.

EPM techniques risk

The Fund may engage in EPM techniques including holdings of derivative instruments. Whilst intended to reduce risk, the use of these instruments may expose the Fund to increased price volatility.

Exchange rate risk

Investing in assets denominated in a currency other than the base currency of the Fund means the value of the investment can be affected by changes in exchange rates.

Interest rate risk

Fixed interest securities are particularly affected by trends in interest rates and inflation. If interest rates go up, the value of capital may fall, and vice versa. Inflation will also decrease the real value of capital.

Liquidity risk

In difficult market conditions the value of certain fund investments may be difficult to value and harder to sell, or sell at a fair price, resulting in unpredictable falls in the value of your holding.

Emerging markets risk

Investing in Emerging Markets may provide the potential for greater rewards but carries greater risk due to the possibility of high volatility, low liquidity, currency fluctuations, the adverse effect of social, political and economic instability, weak supervisory structures and accounting standards.

Counterparty risk

The insolvency of any institutions providing services such as safekeeping of assets or acting as counterparty to derivatives or other instruments, may expose the Fund to financial loss.

Fund investing in funds risk

The Fund is valued using the latest available price for each underlying investment, however it may not fully reflect changing stockmarket conditions and the Fund may apply a 'fair value price' to all or part of its portfolio to mitigate this risk. In extreme liquidity conditions, redemptions in the underlying investments, and/or the Fund itself, may be deferred or suspended.

Glossary

Asset allocation

Breakdown of the assets by asset classes. Based on RLAM asset classification scheme.

Bonds

Securities that represent an obligation to repay a debt, with interest. Investment grade bonds are high quality bonds that are viewed as being highly likely to make all scheduled payments of interest and principal. Low quality bonds carry higher risk but also typically pay higher rates of interest. Corporate bonds are those issued by companies to raise finance.

Efficient Portfolio Management (EPM) techniques

The Fund may engage in EPM techniques including holdings of derivative instruments. The use of these instruments may expose the Fund to volatile investment returns and increase the volatility of the net asset value of the Fund. EPM techniques may involve the Fund entering into transactions with counterparties where there may be a risk of counterparty default. The Fund's ability to use EPM strategies may be limited by market conditions, regulatory limits and tax considerations.

Geographical breakdown

Breakdown of assets by geographical regions. 'Global' region includes global fixed income and overseas securities exposures, which are sterling hedged and commodity exposures.

Performance

Fund performance is based on 2pm prices.

Pricing

The Fund's price may swing to bid or offer to protect existing investors from the costs associated with buying or selling the fund's underlying assets when other investors are entering or leaving the fund. Performance is based on this pricing.

Top 10 holdings

Top 10 assets held by market value, excluding derivatives and cash.

Total return

A total return is a combination of capital growth and income. Capital growth is defined as the rise in an investment's value over time and income as the payment an investment generates, such as dividends or bond coupons.
